Human LR3 IGF-1 / IGF-I / IGF1 Protein

Catalog Number: 10598-HNAY1

General Information

Gene Name Synonym:
IGF-1; IGF-I; IGF1A; IGF; IGF?; MGF

Protein Construction:
A DNA sequence encoding the human IGF1 (P05019, E51R) (Gly49-Ala118) was expressed with a 13 amino acids (MFPAPlSSLFVN)at its N-terminus.

Source: Human
Expression Host: Yeast

QC Testing
Purity: > 95% as determined by SDS-PAGE.

Bio Activity:
Measured in a serum-free cell proliferation assay using MCF7 human breast cancer cells. The ED50 for this effect is typically 1.5-6 ng/mL.

Endotoxin:
Please contact us for more information.

Stability:
Samples are stable for up to twelve months from date of receipt at -70 °C

Predicted N terminal: Met 1

Molecular Mass:
The recombinant human IGF1 consists of 83 amino acids and predicts a molecular mass of 9.1 kDa.

Formulation:
Lyophilized from sterile PBS,pH7.4.

Normally 5 % - 8 % trehalose, mannitol and 0.01% Tween80 are added as protectants before lyophilization. Specific concentrations are included in the hardcopy of COA. Please contact us for any concerns or special requirements.

Usage Guide

Storage:
Store it under sterile conditions at -20°C to -80°C upon receiving. Recommend to aliquot the protein into smaller quantities for optimal storage.

Avoid repeated freeze-thaw cycles.

Reconstitution:
Detailed reconstitution instructions are sent along with the products.

SDS-PAGE:

Protein Description

IGF I, also known as mechano growth factor, somatomedin-C, IGF-I and IGF1, is a secreted protein which belongs to the insulin family. The insulin family, comprised of insulin, relaxin, insulin-like growth factors I and II (IGF-I and IGF-II) and possibly the beta-subunit of 7S nerve growth factor, represents a group of structurally related polypeptides whose biological functions have diverged. The IGFs, or somatomedins, constitute a class of polypeptides that have a key role in pre-adolescent mammalian growth.

IGF-I expression is regulated by GH and mediates postnatal growth, while IGF-II appears to be induced by placentactogen during prenatal development. IGF1 / IGF-I may be a physiological regulator of [1-14C]-2-deoxy-D-glucose (2DG) transport and glycogen synthesis in osteoblasts. IGF1 / IGF-I stimulates glucose transport in rat bone-derived osteoblastic (PyMS) cells and is effective at much lower concentrations than insulin, not only regarding glycogen and DNA synthesis but also with regard to enhancing glucose uptake. Defects in IGF1 / IGF-I are the cause of insulin-like growth factor I deficiency (IGF1 deficiency) which is an autosomal recessive disorder characterized by growth retardation, sensorineural deafness and mental retardation.
