Influenza A H10N8 (A/Jiangxi-Donghu/346/2013) Hemagglutinin / HA1 Protein (His Tag)
Catalog Number: 40359-V08H1

General Information

Gene Name Synonym:
HA

Protein Construction:
A DNA sequence encoding the full length of Influenza A virus (A/Jiangxi-Donghu/346/2013(H10N8)) hemagglutinin (translated amino acid sequence of EPI497477 ) (Met1-Arg340), termed as HA, was expressed with a polyhistidine tag at the C-terminus.

Source: H10N8
Expression Host: HEK293 Cells

QC Testing

Purity: > 95 % as determined by SDS-PAGE.

Endotoxin: < 1.0 EU per µg protein as determined by the LAL method.

Stability:
Samples are stable for up to twelve months from date of receipt at -70 ℃

Predicted N terminal: Leu 17

Molecular Mass:
The recombinant HA1 subunit of the influenza A virus (A/Jiangxi-Donghu/346/2013(H10N8)) hemagglutinin consists 335 amino acids and predicts a molecular mass of 36.9 kDa.

Formulation:
Lyophilized from sterile PBS, pH 7.4.

Normally 5 % - 8 % trehalose, mannotol and 0.01% Tween80 are added as protectants before lyophilization. Specific concentrations are included in the hardcopy of COA. Please contact us for any concerns or special requirements.

Usage Guide

Storage:
Store it under sterile conditions at -20℃ to -80℃ upon receiving. Recommend to aliquot the protein into smaller quantities for optimal storage.

Avoid repeated freeze-thaw cycles.

Reconstitution:
Detailed reconstitution instructions are sent along with the products.

SDS-PAGE:

Protein Description

The influenza viral Hemagglutinin (HA) protein is a homo trimer with a receptor binding pocket on the globular head of each monomer.HA has at least 18 different antigens. These subtypes are named H1 through H18.HA has two functions. Firstly, it allows the recognition of target vertebrate cells, accomplished through the binding to these cells’ sialic acid-containing receptors. Secondly, once bound it facilitates the entry of the viral genome into the target cells by causing the fusion of host endosomal membrane with the viral membrane. The influenza virus Hemagglutinin (HA) protein is translated in cells as a single protein, HA0, or hemagglutinin precursor protein. For viral activation, hemagglutinin precursor protein (HA0) must be cleaved by a trypsin-like serine endoproteinase at a specific site, normally coded for by a single basic amino acid (usually arginine) between the HA1 and HA2 domains of the protein. After cleavage, the two disulfide-bonded protein domains produce the mature form of the protein subunits as a prerequisite for the conformational change necessary for fusion and hence viral infectivity.
